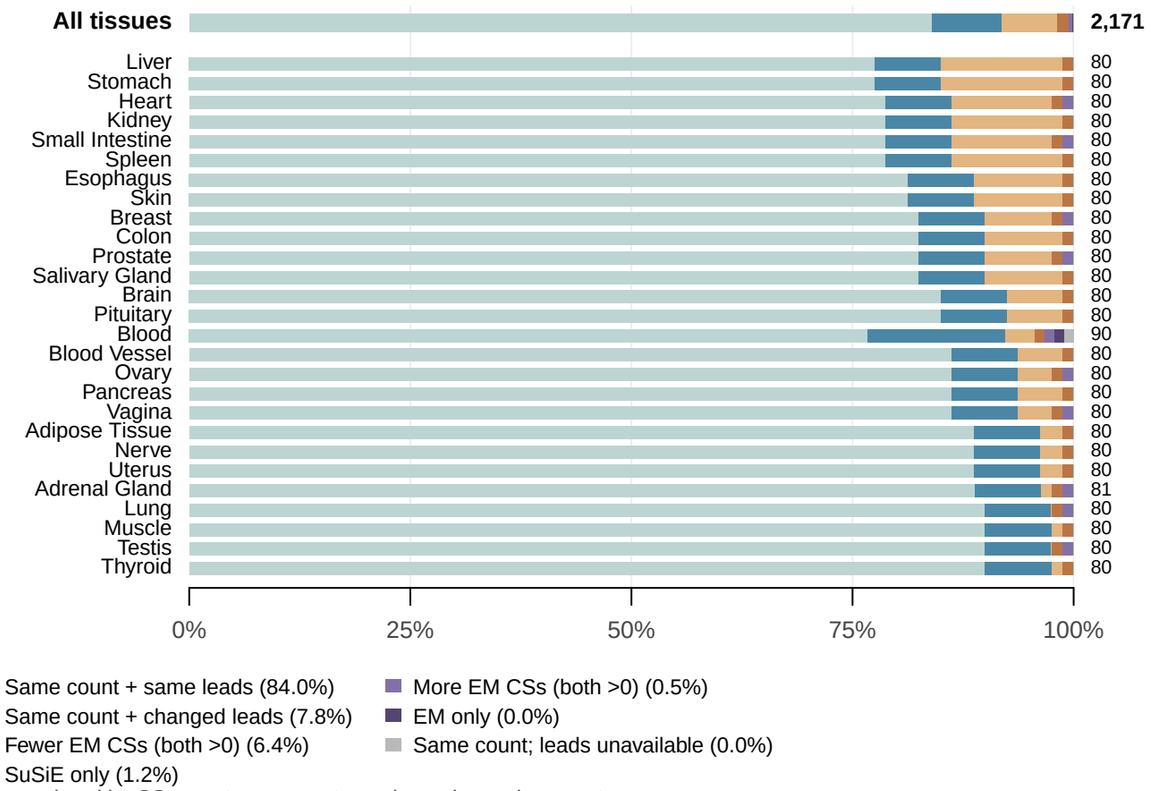
Fine−mapping under additive and mixed genetic models

EM iteration 18 | 2,171 gene−tissue regions | 2,171 genes | 27 tissues

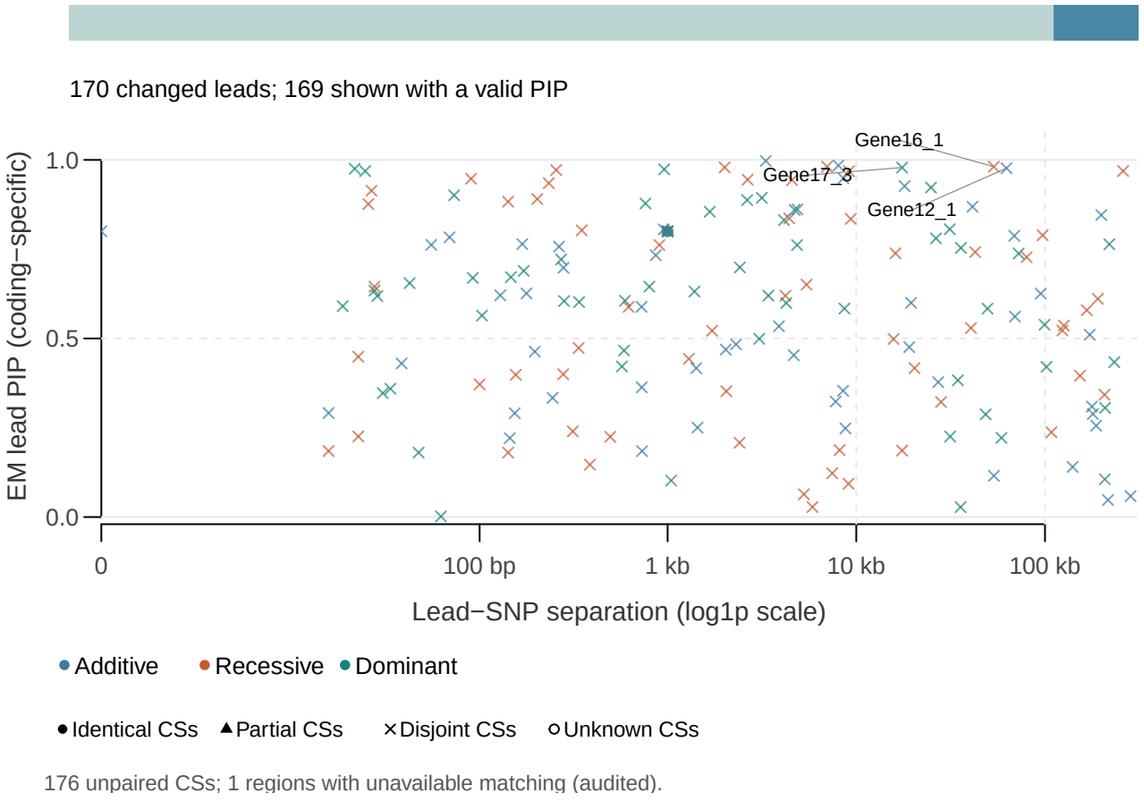
A Signal architecture across tissues



Rows ordered by CS−count agreement; numbers give region counts.

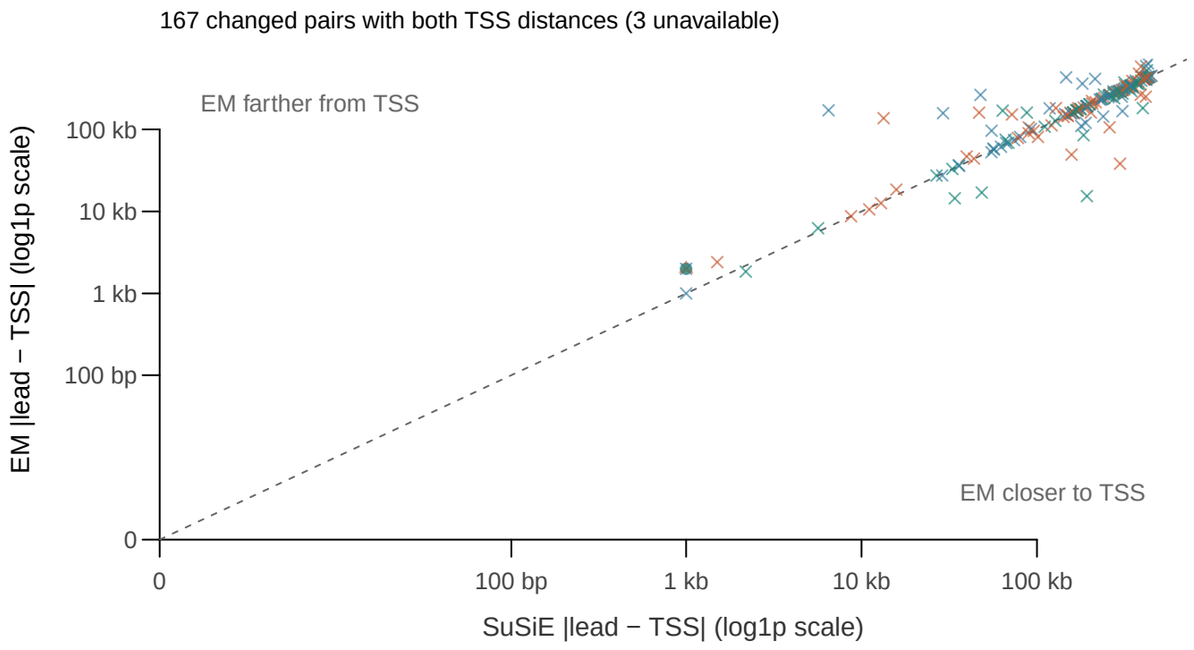
B Lead changes and posterior support

1,972 / 2,142 paired leads retained (92.1%)



176 unpaired CSs; 1 regions with unavailable matching (audited).

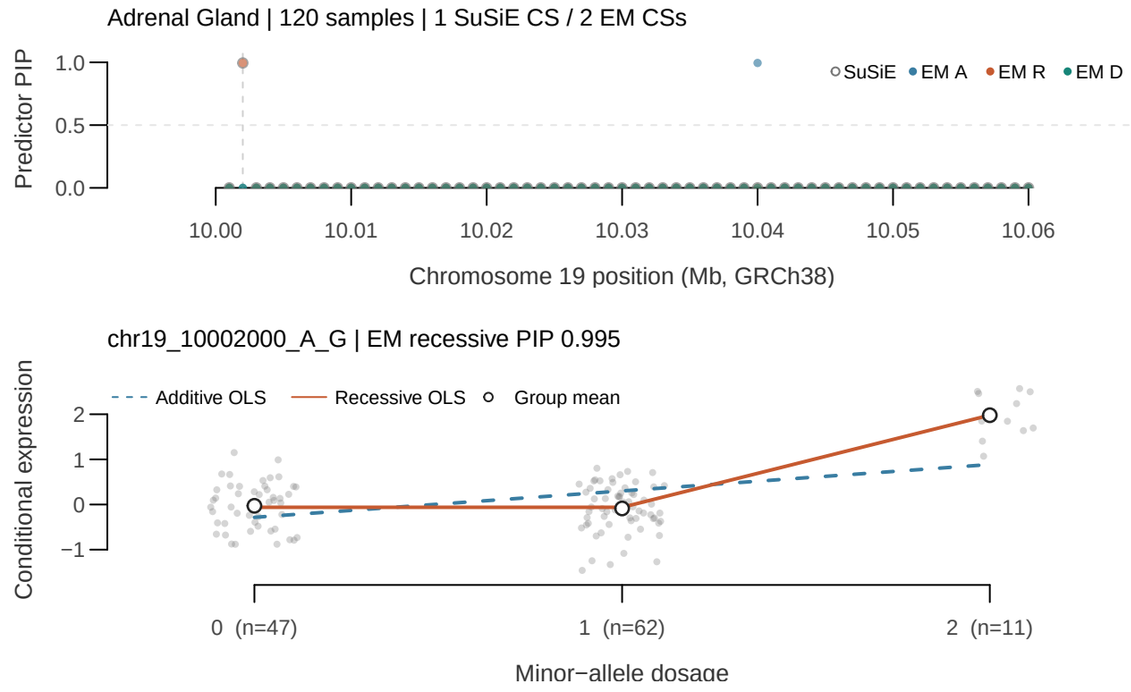
C Do lead changes move toward the TSS?



Closer: 80 | Equal: 1 | Farther: 86 | Median change: 0 kb

Colors and shapes as in B. Proximity to TSS does not establish causal accuracy.

D CYP4F11: shared variant, different coding



Other EM CSs: CS 2: 19 SNPs, lead PIP 0.995

Expression adjusted for other EM CS leads; OLS curves are descriptive.

Shared cohort: additive P < 1e−08; mean reads >= 100; >=1 CS in either model. B/C: matched CS subsets; D: one included region.

SYNTHETIC VALIDATION − NOT GTEx RESULTS
